

Superstore Sales Analysis

SQL Data Analyst Portfolio Project

Business objective

Analyze retail sales, customers, products, geography and shipping operations using SQL.

Dataset Snapshot

Metric	Value
Rows	9,800
Orders	4,922
Customers	793
Products	1,861
Total sales	\$2,261,536.78

Analysis areas

- Executive KPIs
- Monthly sales and MoM growth
- Category and sub-category performance
- Top products and customers
- Segment, region, state and city analysis
- Shipping mode and delivery time
- Revenue share and running totals
- Top products within each category
- Top customers within each segment
- Repeat customers and multi-product orders

SQL techniques demonstrated

- Data-quality checks
- GROUP BY / HAVING
- COUNT(DISTINCT)
- CASE WHEN
- CTEs
- LAG()
- ROW_NUMBER()
- DENSE_RANK()
- Window SUM()
- Running totals
- Revenue-share analysis

Interview-ready explanation

I analyzed a retail Superstore dataset using MySQL. I started with data-quality checks, created sales KPIs, then analyzed monthly trends, products, customers, categories, segments and regions. I used CTEs and window functions for month-over-month growth, running totals and ranking, and analyzed shipping time for an operational view.
